

1 Did I hear you second?

2 DR. SPECTER: I second.

3 DR. CHARACHE: All right. Let's vote on that.

4 DR. SPECTER: I am in favor.

5 DR. CHARACHE: Dr. Reller?

6 DR. RELLER: Between the two of us, it has been  
7 made and seconded, so it's time to vote.

8 Yes.

9 DR. TUAZON: Yes.

10 DR. SANDERS: Yes.

11 DR. SEEFF: Yes.

12 DR. WILSON: Yes.

13 DR. THRUPP: Yes.

14 DR. CHARACHE: All right. It's also unanimous.

15 Are there any other conditions? Dr. Thrupp?

16 DR. THRUPP: At the risk of invoking more  
17 discussion--but we have already discussed it, so we  
18 shouldn't have to discuss it too much more--I would suggest  
19 the recommendation that in addition to the sentence which we  
20 have already voted upon that Dr. Reller proposed for  
21 addition to the Intended Use paragraph at the very beginning  
22 of the package insert, that a third sentence--that is, a  
23 second new sentence--be added, that sentence being  
24 essentially the second sentence from the top of page 7 about  
25 the acute infection limitation, and that sentence might say

1 for clarity: "A nonreactive antibody test result does not  
2 exclude the possibility of exposure to HCV or early acute  
3 infection with HCV." Actually, I went to cross out  
4 "exposure," because exposure isn't necessarily infection.  
5 Let me say it again.

6 "A nonreactive antibody test result does not  
7 exclude the possibility of early acute infection with HCV."

8 DR. CHARACHE: So it is to delete the word  
9 "exposure" and change that to "early acute infection with  
10 HCV."

11 DR. THRUPP: It would leave out "exposure" and be  
12 "the possibility of early acute infection with HCV." And I  
13 would put that in the Intended Use as a caution.

14 DR. CHARACHE: Okay. Do we have a second?

15 [No response.]

16 DR. CHARACHE: Okay. So we will suggest that the  
17 FDA consider that sentence and whether it is appropriate,  
18 but we don't have a second, so we will not carry it further  
19 at this time.

20 Are there any other recommendations for  
21 conditions?

22 [No response.]

23 DR. CHARACHE: Okay. Hearing none, we'll call the  
24 vote.

25 So the vote was approval with conditions, and

1 there were two conditions. The first recommendation was  
2 that the statement on the bottom of page 7 be made clear and  
3 prominent to indicate the desire of this panel to have  
4 confirmatory testing performed with reactive samples in  
5 appropriate settings without undue penalty to the  
6 manufacturer.

7 The second was pertaining to wording that  
8 indicates that the high-risk patients be divided--after the  
9 statement of high-risk patients in Table 5, list the three  
10 categories of high-risk patients separately so they can be  
11 analyzed, and that there be an indication that emphasizes  
12 that this is descriptive of the population studied and not  
13 recommendations for specific testing--whatever wording  
14 appears appropriate to the FDA and the sponsor.

15 We'll take a vote on that, and this time, we'll  
16 start with Dr. Thrupp.

17 DR. THRUPP: Yes.

18 DR. WILSON: Yes.

19 DR. SEEFF: Yes.

20 DR. SANDERS: Yes.

21 DR. TUAZON: Yes.

22 DR. RELLER: Yes.

23 DR. SPECTER: Yes.

24 DR. CHARACHE: So this is unanimous approval with  
25 those two conditions, the details to be worked out.

1 Thank you very much.

2 Let's go right on now. I think we will probably  
3 spent 15 or perhaps 20 minutes on the last item, which is  
4 that pertaining to archive samples. If we could put up the  
5 questions, let's look at all three questions and then see if  
6 we want to answer them separately or whether it is  
7 appropriate to address the issues raised without necessarily  
8 debating each question.

9 Dr. Ticehurst?

10 DR. TICEHURST: While Tom Simms is doing  
11 Electricity 101 here, I am probably just as fresh as you all  
12 are here, and what I'd like to do is provide a little bit of  
13 background on this concept of specimen archives, that  
14 actually followed both previous major discussions over the  
15 past few days but particularly the one yesterday.

16 The idea of specimen archives--and I avoided the  
17 use of the term "panel" here which is often used, because  
18 you guys are a panel, and you get involved in different  
19 kinds of panels--so the terminology that is being used here  
20 is "specimen archives" to refer to specimens selected for  
21 whatever reasons that are then put into a collection and can  
22 be pulled back out again.

23 I'm going to start going through the text of the  
24 slides that are going to come up for expediency.

25 The first principle is that an archive or archives of highly

1 characterized, well-maintained specimens would be a great  
2 advantage to this whole process we are talking about here,  
3 the process of evaluating assays for viral hepatitis.

4         The first point is that they improve the quality  
5 of premarket evaluations and improve the quality of package  
6 inserts, because the specimens that could go into such an  
7 archive can be put in by recognizing the bias that is being  
8 used to select to put them in and making that bias as  
9 appropriate as possible. And second, by having those as a  
10 component of each submission, they enable consistency  
11 between submissions; they become an element of each  
12 submission. They also become an element that the  
13 prospective user can use as a source of comparison between  
14 submissions.

15         The second point is that it reduces the burden on  
16 the manufacturer. These become an identified source of  
17 appropriate specimens--not "the" identified source but "an"  
18 identified source.

19         May I borrow your pointer, please, Tom?

20         [Slide.]

21         So in our collective stupor here, I have already  
22 addressed the first several bullets, and now I am onto the  
23 last one here, and actually, I have already addressed that  
24 one. At least in terms of these specimens, there is less  
25 data for them to generate and prepare, because the

1 characteristics of these specimens are already known.

2 DR. SEEFF: John, is this your effort at FDA?

3 DR. TICEHURST: I think I will answer your  
4 question by continuing, Dr. Seeff. Thank you.

5 [Slide.]

6 Within the Microbiology Branch, we have had a long  
7 history of recommending such archives to certain other  
8 microorganisms, in particular, assays for antibodies for  
9 borrelia bergdorferi [ph.] and assays for antibodies to  
10 herpes simplex viruses.

11 At a previous meeting of this panel a little less  
12 than two years ago, this whole concept came up a number of  
13 times as a suggestion and an approach to coupling two  
14 factors. One was the need for data from appropriate  
15 specimens--again, this goes back to the kinds of discussions  
16 that were held yesterday and today--including serially  
17 collected specimens, coupling that with the difficulties in  
18 obtaining these specimens, either prospectively or from  
19 other sources in a retrospective forum.

20 As I mentioned in my comments this morning, we  
21 repeatedly hear from the manufacturers that they have a very  
22 difficult time in any way, not even just in a cost way, of  
23 obtaining these appropriate specimens, particularly if they  
24 represent serially collected specimens.

25 [Slide.]

1           Hopefully, Dr. Seeff, this addresses your  
2 question. Those of us in the Microbiology Branch have been  
3 actively seeking the development of such specimen archives a  
4 this point via discussions with other groups within the  
5 Department of Health and Human Services, several agencies  
6 within DHHS, and also through a number of discussions and by  
7 collecting information from companies that collect, maintain  
8 and sell such specimens. You heard from one such company  
9 yesterday. I would mention that at this point in time, we  
10 do not regulate these companies. These specimens are sold  
11 without FDA oversight.

12           [Slide.]

13           There are a lot of technical issues that relate to  
14 these specimens, and I am talking about the integrity of the  
15 specimens once they have been selected that I am sure you  
16 are all familiar with that have to do with do you aliquot  
17 them, how do you aliquot them, how do you maintain them,  
18 alarms on freezers, what are the criteria to keep them and  
19 so forth. These basically are quality control and quality  
20 assurance issues, but one in particular that probably would  
21 have been more apparent yesterday was to deal with the  
22 recognized liability of IgM antibodies, and this, of course,  
23 would pertain to IgM anti-HCV and would also potentially  
24 pertain to IgM anti-HAV, and in the event that any similar  
25 assay was developed for HCV at some point, and considering

1 other hepatitis viruses that might come down the line as  
2 well, like HEV, for example.

3 That was the background. Now, the questions,  
4 which I am not the author of but the messenger, but I will  
5 try to put some context with them, are as follows. Will the  
6 use of characterized viral hepatitis archives provide  
7 assurance of assay safety and effectiveness in various  
8 populations? To try to clarify this a little bit, what this  
9 question is asking, which may have an obvious answer, is:  
10 Is this a good idea?

11 The second part of it that might not be clear is  
12 "various populations." In general, I think those would  
13 refer to populations that would pertain to well-recognized  
14 or potential indications for use. So if we could take some  
15 of the discussion today, such a population might be a  
16 population of acute HCV infections and so forth.

17 [Slide.]

18 What criteria should be used to include specimens  
19 in these archives? I think that here, the word "criteria"  
20 can be a very loaded term. In general, I think this could  
21 refer to the information about the specimens. It could  
22 include things like clinical background, other laboratory  
23 data, results from reference assays, results from a  
24 consensus of reference assay testing. Other criteria could  
25 be deciding how to prioritize which specimens are the most

1 important first. Would it be more important, for example,  
2 if you are thinking about HCV, to have well-characterized  
3 specimens representing chronic HCV versus those representing  
4 acute HCV? If you are going to have specimens representing  
5 the indication for anti-HBS assays of assessing unity post-  
6 vaccination, what kinds of criteria would be used to select  
7 those, and so forth? How stringent should those criteria  
8 be? We have had discussions both yesterday and today about  
9 stringent criteria versus less stringent criteria. And  
10 obviously, these criteria would depend on the purpose of a  
11 given group of specimens.

12 Finally, the last question, which to me seems a  
13 lot like the first one: Will archives be sufficient to  
14 support claims for a diagnosis of HBV infection--I think  
15 this could be substituted with any of the five known viruses  
16 at this point in time--A, B, C, D, and E--or immunity in all  
17 indicated populations. I think that where this differs from  
18 the first question is what other kinds of things might be  
19 needed, and as a specific point, what are the advantages  
20 that fresh, not previously frozen specimens provide that  
21 would not be encompassed in an archive?

22 Thank you.

23 DR. CHARACHE: Thank you.

24 Let's put up the first question.

25 Dr. Thrupp?

1 DR. THRUPP: As a matter of background  
2 information, you indicated that your division of the FDA has  
3 been using archive specimens in evaluating previous other  
4 devices, other serologic tests. Do you have any experience  
5 that could be related from those previous archive specimens  
6 that would indicate that they were misleading? For example,  
7 were they too circumscribed and too limited a group that  
8 when you got into the field experience, there were errors or  
9 problems that were not predicted by the archived sampling,  
10 or where the archives turned out to be inadequate or poorly  
11 defined, or have they in fact been very helpful, and you  
12 haven't had any problems with the archives?

13 DR. TICEHURST: I'm not going to give you a great  
14 answer to that question. I am not familiar with the  
15 characteristics of the anti-HSV's archives, and I think  
16 there are some people who might be able to address that  
17 better than I if they would like to.

18 I have dealt directly with data from the archives  
19 that pertain to anti-borrelia [ph.], and I think that that's  
20 a good example to consider. I haven't looked at data from  
21 recent submissions, so I am reflecting on things that I did  
22 a couple of years ago.

23 Part of the problem there is, as many of you know,  
24 that it is very difficult, short of having culture or  
25 perhaps detecting borrelia DNA to come up with--I'm sorry--

1 it is relatively easy to come up with people who meet strict  
2 criteria for an acute borrelia infection. I'm speaking  
3 particularly here about borrelia bergdorferi. It is more  
4 difficult to come up with criteria for people who meet  
5 strict criteria for a chronic bergdorferi infection. It is  
6 pretty easy to come up with a lot of people who meet  
7 somebody's criteria for bergdorferi infections, because  
8 there are things involved with rashes and so forth and so  
9 on.

10 The particular collections that I am referring to  
11 are maintained at CDC and are made available, and generally,  
12 our branch insists that the manufacturer of an anti-borrelia  
13 assay use those specimens, and they provide very useful  
14 information, but there are a lot of limitations in that  
15 information.

16 DR. CHARACHE: Okay. I think maybe we can move  
17 this along a little bit with the first question. I wonder  
18 if the group might feel that the characterized viral  
19 hepatitis archives could provide assistance--this isn't  
20 saying yet whether it is the only thing you need or not--in  
21 various populations if the archive has been appropriately  
22 clarified and designated in terms of collection of  
23 information required and has been collected and stored in a  
24 manner that is appropriate to preserving the factors that  
25 you are trying to assay.

1 Would that perhaps summarize Question 1?

2 DR. THRUPP: Amen.

3 DR. CHARACHE: Yes?

4 DR. EDELSTEIN: I think that there are a number of  
5 broad issues. One, I don't think that we as a panel can  
6 give expert advice as far as what specific populations  
7 should be considered for an archive. My suggestion would be  
8 to convene a special panel of hepatologists in this case for  
9 that.

10 What I would be concerned about from the  
11 laboratory standpoint is that there are several things you  
12 have to consider. One is will there be specific effects on  
13 certain matrices with storage that you can't predict until  
14 you run it; so you are always going to need some means of  
15 backing up your archival specimens with fresh specimens to  
16 determine that there is no adverse effect of storage on  
17 certain matrices or certain methods of analysis.

18 The second restraint that you have is you have to  
19 make certain that in your defined populations, they are not  
20 so polar that you exclude the patients who have close to  
21 equivocal results, because those are the most valuable for  
22 determining the true performance of the assay. If you have  
23 people who would have, let's say, assay values of 5,000 or  
24 assay values of 5, that is useful, but you also need another  
25 population where you have some equivocal range values to

1 help you out.

2 DR. CHARACHE: All right. We have now listed four  
3 requirements to make this safe and effective for use. The  
4 first is appropriate clinical information, and we haven't  
5 defined what that is. The second is appropriate collection  
6 and storage and aliquoting and so on, handling of the  
7 sample. Third is documentation that there are no matrix  
8 effects that would adversely affect it. And fourth is that  
9 the populations not be so polar, not so yes-and-no, that you  
10 can't pick up the key information at the break point or in  
11 the middle somewhere.

12 Are there any other factors we would like to  
13 address?

14 DR. EDELSTEIN: I'm sorry--there is one more in  
15 that we have seen over the last two days that sometimes,  
16 knowing as much about the patient as possible is very  
17 helpful in trying to interpret a result. So if there were  
18 some way of getting archival information that would include  
19 follow-up, clinical data, from the time the specimen was  
20 drawn, plus retrospective information prior to the time the  
21 sample is drawn, that would be of real important or could be  
22 of real importance.

23 DR. CHARACHE: Dr. Seeff?

24 DR. SEEFF: Archive specimens are extremely  
25 important. Anything that I personally have ever done has

1 come out of archive specimens going back 50 years. So I  
2 think the existence of archive specimens is very important.  
3 I know, for example, that NHLBI has a large repository with  
4 a committee on which I happen to serve, but these are being  
5 collected through studies that NHLBI has supported.

6 NIDDK is now thinking of setting up a repository.  
7 This is slightly different. This is for the purpose of  
8 supporting, presumably, companies who many need to have  
9 identified samples.

10 One problem we face is linkage and the problem of  
11 having specimens and wanting to go back and do tests on  
12 individuals for whom you don't have permission. I am facing  
13 that now in a couple of studies, and it's a real problem,  
14 how to go about it. I suppose, if you are going to develop  
15 a new set of samples by drawing blood from people now with  
16 acute hepatitis or chronic hepatitis or whatever form of  
17 liver disease you want, I suppose you could have a consent  
18 form which says we are drawing blood specifically for this  
19 purpose, and the purpose of this is to go back and test it,  
20 and we may want to do a whole variety of tests over the next  
21 25 or 50 years as new things become available, and if they  
22 consent to that, then I guess that might be fine. But  
23 otherwise, the problem of testing and linking--and I think  
24 linkage is very important; I agree with what was discussed,  
25 that without knowing the clinical circumstances--and also,

1 follow-up is extremely useful--it loses part of its  
2 usefulness.

3 So I think this is an issue that we need to be  
4 very cautious about, and you and I touched on it when we  
5 discussed this in the car, that maybe this is an issue that  
6 has to be raised.

7 DR. CHARACHE: Are there any other comments on  
8 Question 1?

9 DR. NOLTE: We're not talking about replacing  
10 fresh clinical specimens with archived; we're talking about  
11 using them to supplement--correct?

12 DR. CHARACHE: That's what this one is. We'll  
13 come to another--

14 DR. GUTMAN: Well, actually, it depends on whether  
15 you decide to rewrite "assist" versus "assurance". There is  
16 an implication here--and actually, this has implications  
17 beyond viral hepatitis, because we will be studying diseases  
18 in the future, perhaps genetic markers where prospective  
19 studies can't be done, and we may need to look at some kind  
20 of banking samples. So it really has very broad  
21 implications.

22 I don't mean to be provocative or leading,  
23 especially late on a Friday, but I will--the deal here was  
24 that yesterday, we had a product before the panel--I  
25 wouldn't wish to suggest that the panel is required to be

1 any more or less consistent than the FDA--but we had a  
2 product before the panel which was based very heavily on  
3 archived samples, and the issue that I actually asked the  
4 panel about wasn't whether it was okay to use archive  
5 samples or not. I thought the issue was where they  
6 characterized appropriately with appropriate follow-up or  
7 lack of follow-up; did they have the stability issues  
8 resolved. Yesterday's may or may not have had them  
9 resolved. Had they been stored correctly; were there  
10 representative populations or biased populations.

11 Assuming we could deal with that with B or C or D  
12 or E or F or G or whatever, assuming we could deal with  
13 this, would you be comfortable if we came through and  
14 essentially maybe had fresh samples on some donors and had  
15 our disease characterized with archive samples? Is that  
16 established for a well-established marker for B, but not for  
17 a new marker like E or G, or something else?

18 DR. THRUPP: That gets to Question 3, which  
19 essentially asks are the panels enough by themselves, or  
20 what else do you need.

21 DR. CHARACHE: Yes. I think that was what I was  
22 thinking. I guess, though, this is a point--this says  
23 "provide assurance of safety and efficacy," and I was  
24 reading it as "provide assistance"; so I think we've been  
25 talking about it as assistance, and we'll get to 3, and

1 we'll say "assurance".

2 Yes, Dr. Gates?

3 DR. GATES: Kind of to Steve's point, it seems to  
4 me that given the caveats in terms of the characterization  
5 and everything, that if that's true, there is no real  
6 advantage in prospective studies if you have archive samples  
7 like this in addition, that archive samples have an  
8 additional advantage in that you can basically standardize  
9 tests across different products. It has been done in the  
10 past for susceptibility testing and stuff like that, with  
11 resistance panels. You can start getting a real good idea  
12 of how one test compares to another test because you're  
13 using the same set of standards.

14 So to my mind, it seems like there are advantages  
15 here and not any real disadvantages.

16 DR. CHARACHE: Dr. Wilson?

17 DR. WILSON: There are clearly advantages to  
18 having pools of well-characterized, properly stored sera for  
19 the reasons that have been given. But on the other hand,  
20 what are these products going to be used to test in the real  
21 world? People just don't collect blood. I mean, you can  
22 collect serum in one of several different ways. There is a  
23 movement going on in this country with these pediatric tubes-  
24 for adults. We found that clearly, those don't behave the  
25 way adult tapes do. So there are a lot of factors that are

1 only going to come out in clinical trials.

2 So I think that relying on these solely as the  
3 basis upon which to make a decision would be wrong. I think  
4 you still need to have prospective clinical trials to ferret  
5 out how things work in the real world.

6 DR. CHARACHE: Other comments?

7 Dr. Nolte?

8 DR. NOLTE: I think that clearly today we saw a  
9 good example of how well-characterized panels could be  
10 meshed with prospectively collected specimens to give a more  
11 or less efficient clinical trial of the product. So I don't  
12 know exactly whom I agree with, but certainly, in my mind,  
13 I'm not thinking about replacing a clinical trial with a  
14 well-characterized archive panel. There has got to be a  
15 component of that if what you are trying to approve is a  
16 diagnostic test that is going to be used in a clinical  
17 laboratory. They are complementary, clearly.

18 DR. CHARACHE: Yes. I think, reinforcing what Dr.  
19 Nolte has said, there was 100 percent specificity in the  
20 archive samples that we were hearing about today, and a 20  
21 percent specificity in the ones that were tested in real  
22 time. The populations weren't the same, but I think this  
23 also helps emphasize one of the points that Dr. Edelstein  
24 made about not having a polar population and ensuring also  
25 that there are no matrix effects and so on.

1 Can we look at Number 2 and see if we have  
2 anything further to add? "What criteria should be used to  
3 include specimens in these archives?"

4 I am going to suggest that it depends on what they  
5 are to be used for. Is there anyone who would like to say  
6 more than that?

7 DR. NOLTE: Someone suggested earlier that it is  
8 going to be a panel on hepatitis, and what we are focused on  
9 are clinical criteria. Maybe we ought to convene a panel of  
10 hepatologists to make that designation.

11 DR. CHARACHE: But I am also going to suggest that  
12 there be criteria for the size of aliquots--in other words,  
13 you might have a few large ones that are then thawed and  
14 refrozen only once and put into small tubes--and that there  
15 be the same type of rigid monitoring of processing and  
16 equipment that we have for laboratory monitoring of process  
17 and equipment, if not more stringent, because there are  
18 going to be used to establish laboratory practices. So  
19 there should be alarms on the freezers; there should be the  
20 appropriate freezer temperature; there should be appropriate  
21 processing of the samples that are originally achieved. And  
22 if they are collected through phlebotomy, as in a  
23 plasmapheresis center, there needs to be very careful  
24 understanding of the anticoagulant effects and the decreased  
25 amounts of calcium and all this kind of thing on the

1 persistence of the factors you want to measure.

2 DR. SPECTER: I think you have to well-define the  
3 source, too, that they come from, either via some kind of  
4 gold standard test, or if there is no such thing, one or  
5 more reference tests, to assure that you have a positive or  
6 a negative, that the individual has a particular condition  
7 or not, or what other conditions the source may have had.  
8 So trying to define the source as well as possible would be  
9 very important.

10 DR. CHARACHE: Other recommendations? I think  
11 this would need to be fleshed out on a test-by-test basis to  
12 some extent. There are some that are global.

13 Number 3. Dr. Stewart, did you want to add  
14 something?

15 DR. STEWART: I was just going to say we have used  
16 both lyophilized serum specimens and the whole frozen  
17 specimens, and the problem we ran into about 20 years ago  
18 was that our rubber stoppers for our lyophilized specimens  
19 were not really air-tight or waterproof, and after about 10  
20 years, we had bricks in our tube instead of something that  
21 would reconstitute. Yet in many ways, if the procedures of  
22 lyophilization have improved, you can be much more sure of  
23 the stability of your product.

24 DR. CHARACHE: Thank you.

25 The last question: "Will archive be sufficient to

1 support the claims of diagnosis of HBV infection or immunity  
2 for all indicated populations?"

3 MR. REYNOLDS: That's going to depend on the  
4 specimens.

5 DR. CHARACHE: Okay.

6 DR. THRUPP: Well, I think the intent of that  
7 question is the point that has already been made many times,  
8 that yes, the archived panels will provide primarily  
9 guidelines in important areas, but no, you still have to  
10 have samples from the real world in order to validate the  
11 assay in real time.

12 DR. CHARACHE: Any other comments?

13 [No response.]

14 DR. CHARACHE: I think the panel strongly supports  
15 the use of appropriate archive samples, but would like to  
16 ensure their comparability to what is going to be seen.

17 I believe this finishes our business. I would  
18 like to thank the panel for hanging in there and for some  
19 hard work and thank the FDA for their support.

20 MS. POOLE: And I'd like to again thank Dr.  
21 Charache; she has been a voting member for four years,  
22 before that a consultant, and if she so desires, she will  
23 stay on as a consultant to the panel.

24 Dr. Gates, we are truly sad to see you go, and  
25 whenever you see the announcement in the future, feel free

1 to apply again. Thank you.

2 And thank you, Dr. Nolte, our guest, and thank  
3 you, Dr. Seeff, and everybody else for coming.

4 DR. CHARACHE: Thank you. I would particularly  
5 like to thank Freddie for keeping me alive for four years.

6 [Applause.]

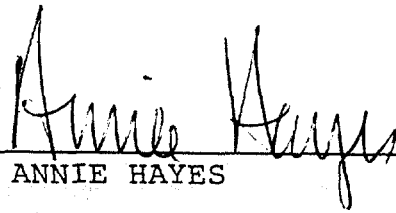

7 [Whereupon, at 3:45 p.m., the proceedings were  
8 concluded.]
